

# CS420/520 — Object-oriented Programming

## Testing

“If it’s not tested, it doesn’t work”

# Why Unit Testing?

- *If it is not tested, it does not work*
- Tests represent an *executable specification* of what the methods *ought* to do
  - non-executable specifications gather dust on shelves.

# Why Unit Testing (2)

- The more time between coding and testing:
  - ▶ More effort is needed to write tests
  - ▶ More effort is needed to find bugs
  - ▶ Fewer bugs are found
  - ▶ Time is wasted working with buggy code
  - ▶ Development time increases
  - ▶ Quality decreases

# Why Unit Testing (3)

- Without unit tests:
  - Code integration is a nightmare
    - Changing code required more courage than I have!

# Why Automated Tests?

- What is wrong with:
  - Using print statements?
  - Writing comments that exercise your code?
  - Writing extra methods that exercise your code?
  - Writing small workspace scripts to run code?
  - Running program and testing it by using it?

# A testing method should:

- Work with  $n$  programmers working for  $k$  months (years)
- Help when modifying code 6 months after it was written
- Check impact of code changes on rest of system
- Work in a school project as well as in industry
  - This is probably unrealistic!
- Help to build good habits and skills

# We have a QA Team, so why should I write tests?

- How long does it take QA to test your code?
- How much time does your team spend working around bugs before QA tests?
- How easy is it to find & correct the errors after QA finds them?
- Most programmers already have an informal testing process
- With a *little* more work you can develop a useful and *reusable* test suite

# When to Write Unit Tests

- *First* write the tests — *Test Driven Development*
- *Then* write the code to be tested
- Writing tests first saves time!
  - Makes you aware of the interface & functionality of the code
  - Removes temptation to skip tests

# SUnit (and JUnit)

- Free frameworks for Unit testing
- SUnit originally written by Kent Beck 1994
- Built into VisualWorks, Squeak, ...
- JUnit written by Kent Beck & Erich Gamma

# Not just for Smalltalk & Java

- Ports are available in:

.NET Ada AppleScript C  
C# C++ Curl Delphi  
Eiffel Eiffel Flash Forte 4GL  
Gemstone/S Haskell HTML Jade  
LISP Objective-C Oracle Palm  
Perl Php PowerBuilder Python  
Ruby Scheme Smalltalk Visual Basic  
XML XSLT

# How to Use SUnit

1. Create a test class as subclass of  
*TestCase*

2. Write test methods

- The framework treats methods starting with 'test' as test methods

3. Run the tests!

- SUnit *TestRunner* is in the image.
- TestBrowser can be downloaded from SqueakMap.

# Don't let slow tests bog you down

- Michael Feathers (<http://tinyurl.com/87nj2>) writes:
- A test is not a unit test if:
  - It talks to the database
  - It communicates across the network
  - It touches the file system
  - It can't run at the same time as any of your other unit tests
  - You have to do special things to your environment (such as editing config files) to run it.

# Rationale

Tests that do these things aren't bad. Often they are worth writing, and they can be written in a unit test harness.

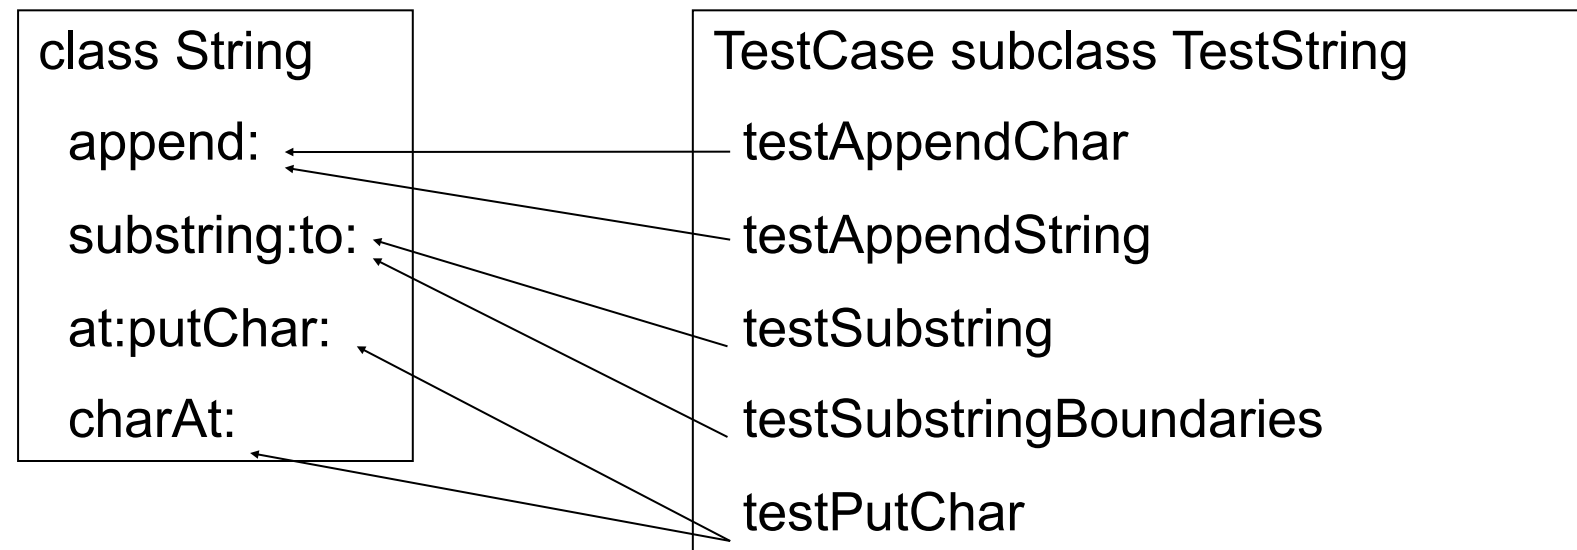

However, it is important to be able to separate them from true unit tests so that we can keep a set of tests that we can run fast whenever we make our changes.

# How to test a client

- So, your job is to write a client that interacts with a database. How do you test it?
- Use *Mock Objects* to simulate the database
  - <http://www.mockobjects.com>
  - *Test Driven Development, A Practical Guide* by David Astels
  - Attend my course on XP!

# Coverage

# Unit Tests: The Internals

- Write like any other method, but **assert**: what you want to happen
  - ▶ **testAppendChar**  
| string |  
string := 'go'.  
string append: ' banana!'.  
self assert: string = 'go banana!'.
- Tests are run with TestRunner or the Package Browser
- So let's write some tests for Strings!

# Asserting more things

- `assert`: takes what you expect to be true
- `deny`: takes what you expect to be false
- `should:raise`: takes a block and the kind of error it should raise
- `shouldnt:raise`: conversely

# Unit Tests: More Details

- The setUp method happens before each testX method (the framework ensures this)
- The tearDown method happens after
- Let's take a look at the official StringTest...

# Best Practices

- Test everything that you want to work
- More test methods in your TestCase than in the class you are testing
- Tests should be as fine grained as possible
- Tests should be independent
- Should not take long to run (a few seconds)
- Easy to understand: tests read like a specification

# Tests as Specification

```
testNewSetIsEmpty
```

```
  assert: [set new isEmpty]
```

```
testSetsDontContainDuplicates
```

```
  a := set new.
```

```
  a add: #aThing.
```

```
  a add: #aThing.
```

```
  self assert: [a size = 1]
```

```
    description: 'sets should not contain duplicates'.
```

```
  a remove: #aThing.
```

```
  self assert: [a isEmpty]
```

# So why Unit Test?

- Not much work to write or run
- Documents your class
- Gives you / others confidence that your code works
- No need to wait for “testing team”
- Tests are fine grained – can be run independently
- Tests can be aggregated easily
- Which tests fail give you a hint of where a bug was introduced
- Form a fairly-complete regression test

# What is Test-Driven Development?

- A new way to build software
- A strict development method:
  - ▶ Add a test.
  - ▶ Run the test.
  - ▶ Make a small change.
  - ▶ Run the tests again. (If they fail, go back to 3)
  - ▶ Refactor (while testing)

# Where did this come from?

- Test-First Development (+refactoring)
- A practice of Extreme Programming
  - Accept and love change
  - Release early, release often
- There are many supposed advantages, but we'll discuss those after we try it

# So let's do it...

- We'll build a little application that represents a network of friends.
- We'll build incrementally
- Build acceptance/unit tests out of “user stories”
- I'll be both the customer and lead developer
  - The customer is on site, so you can ask him questions, but he won't interject
- You'll be developers, too

# So why Test-first?

- You always know what to do next: write a test or make a test pass
- You test code while you are writing it, instead of after you have forgotten about it
- Your tests are always up to date – no backlogs of testing to-do
- You take the customer's point of view – what do I really want the code to do
- The code you have is exactly what is requested – no more, no less

# Patterns for Testing
